# Photoshop Basics To start an image in Photoshop, first make sure that you have the program open. On the left side of the screen, the image you are working on should be in the Portfolio or the Library by default. If it is not, click the New button and navigate to the right folder where you want to save the file to. Once the file is loaded, you'll notice that it has a tab at the top of the image called the Layers panel. You can use the Layers panel to create new layers in a document. You can create a new layer by choosing Layer→New or the Layers icon (Figure 2-1), a dialog box will open and you can name the layer. You can also make an image layer transparent or in-pen, where the image is created by layering a transparent image on top of the other image. You can edit and manipulate layers, but don't forget that they are linked to the underlying images. If you edit or do any kind of alteration to a layer, you'll need to decide whether you want to alter the original image or keep the edited layer and use it as a new layer. Selecting a layer can be tricky. It is actually possible to accidentally select a layer and drag or cut it out of an image. To select a layer, hold the Alt/Option key down and click on a layer. You'll see a red overlay over it, and the layer name will appear in the Layers panel. Figure 2-1. To create a new layer, choose Layer→New or click the Layers icon on the Layers panel. You can add text to a layer or even edit the contents of the Layer Properties box on the right side of the Layers panel. A grid is automatically created so you can easily line up objects in a layer. The Layers panel can help you organize your image and its

As can be seen by reference to the following U.S. Pat. Nos. 3,969,686; 4,162,817; 4,275,982; 4,484,619 and 4,674,694 the prior art is replete with myriad and diverse material dispensing devices. While all of the aforementioned prior art constructions are more than adequate for the basic purpose and function for which they have been specifically designed, these prior art devices are uniformly deficient with respect to their inability to provide a simple, efficient and practical material dispensing system that will enable a user to accurately, positively and easily dispense a wide variety of predetermined or preselected amounts of a material from a housing into a vessel or a container. Perhaps the most prominent example of this deficiency can be found in automotive vehicles where a multiplicity of service personnel are found to be filling up a variety of vessels with a wide variety of different types of fluids. In such an environment it is totally impractical to repeatedly use a hand-held, hand-actuated, manually-operated, pump to dispense predetermined measured quantities of fluid from a container into a vessel. As a consequence of the foregoing situation, there has existed a longstanding need among automobile service personnel, as well as other users, for a new and improved fluid dispenser; and, the provision of such a construction is a stated objective of the present invention.Q: How to add multiple files to a Gemfile using the RubyBuilder I'm currently working with Ruby on Rails and am using the RubyBuilder. The problem is that using the RubyBuilder, I have to add multiple files to the Gemfile but the RubyBuilder doesn't seem to support that. Is there a way to do that? A: The RubyBuilder works through a Rubocop rule that allows you to bundle your files. Instead of using the RubyBuilder to handle that, you would use 'Bundler's require\_gem' and 'require\_bundler' to handle this for you. The example below is for Rails. It assumes you have the relevant Ruby and Rubygems installed. It also assumes you have a base project directory that contains a Gemfile. `#!/usr/bin/env ruby require 'rubygems' require 'bundler/setup' Bundler.require(:default)` If you'd like to access these files from a Ruby project you
